

## Deployment Guideline

- Operating system: Microsoft Windows
- Software: Xampp, Web Browser
- Download Xampp or you can download it from the link given below (any version for windows)  
<https://www.apachefriends.org/download.html>
- Install it on your computer like normal software and remember the installation path.
- Download project from the link given below  
<https://gitlab.com/akash4720/web-chat.git>
- The project will download as a zip file, unzip it
- Copy the project folder and go to your xampp installation folder and then in htdocs folder. If you didn't change the installation path during xampp installation follow this path C:\xampp\htdocs
- Paste the project folder in htdocs.
- Open the xampp control panel and start apache and mysql
- Now, open your favorite browser and on the address bar write  
<http://localhost/phpmyadmin/>
- Create a database called chat. Import the database from project folder
- After creating and importing the database on the browser bar write  
<http://localhost/web-chat>
- It will run the project....
- Enjoy...
